

Hi

You can watch the video:

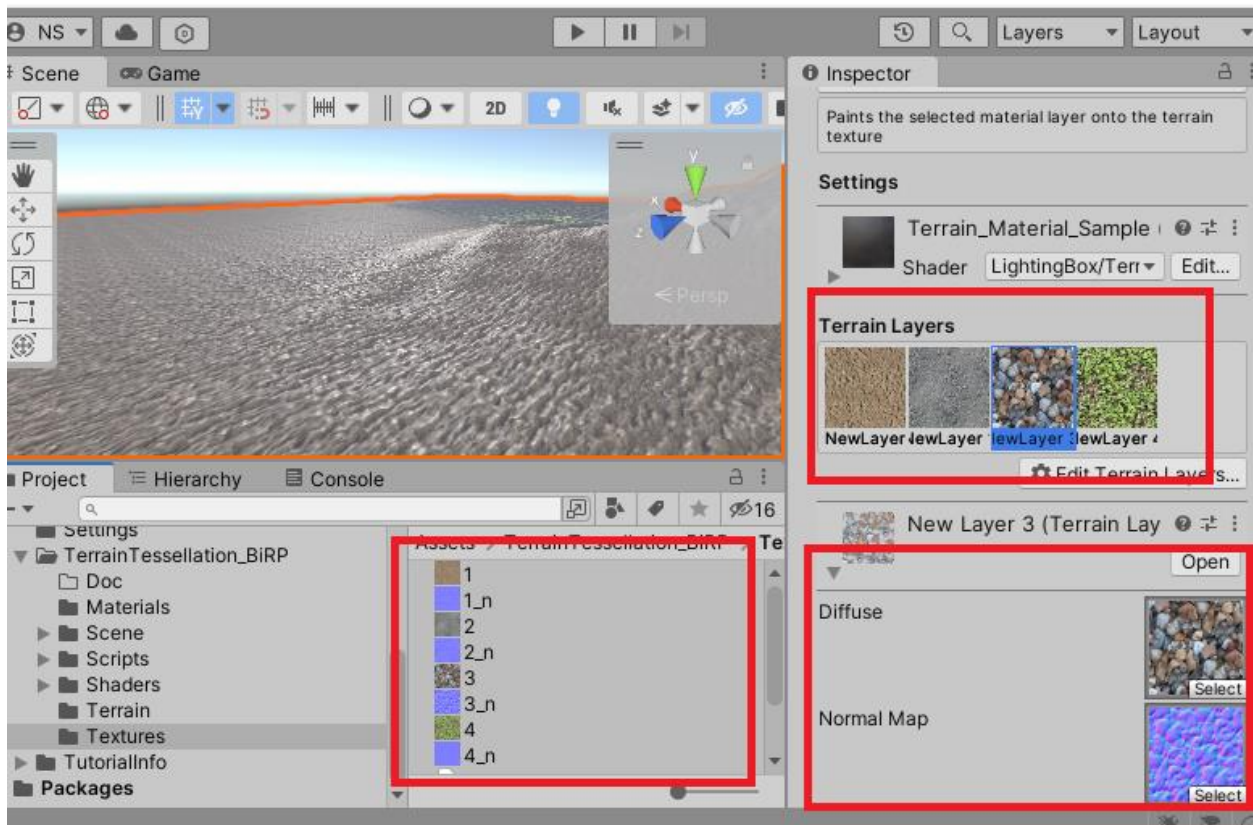

https://youtube.com/playlist?list=PLVXvfvDWvto2zYavncXE-XJW2dGP5d3bP&si=-dDFS_-oiPmlg-_b

Readme:

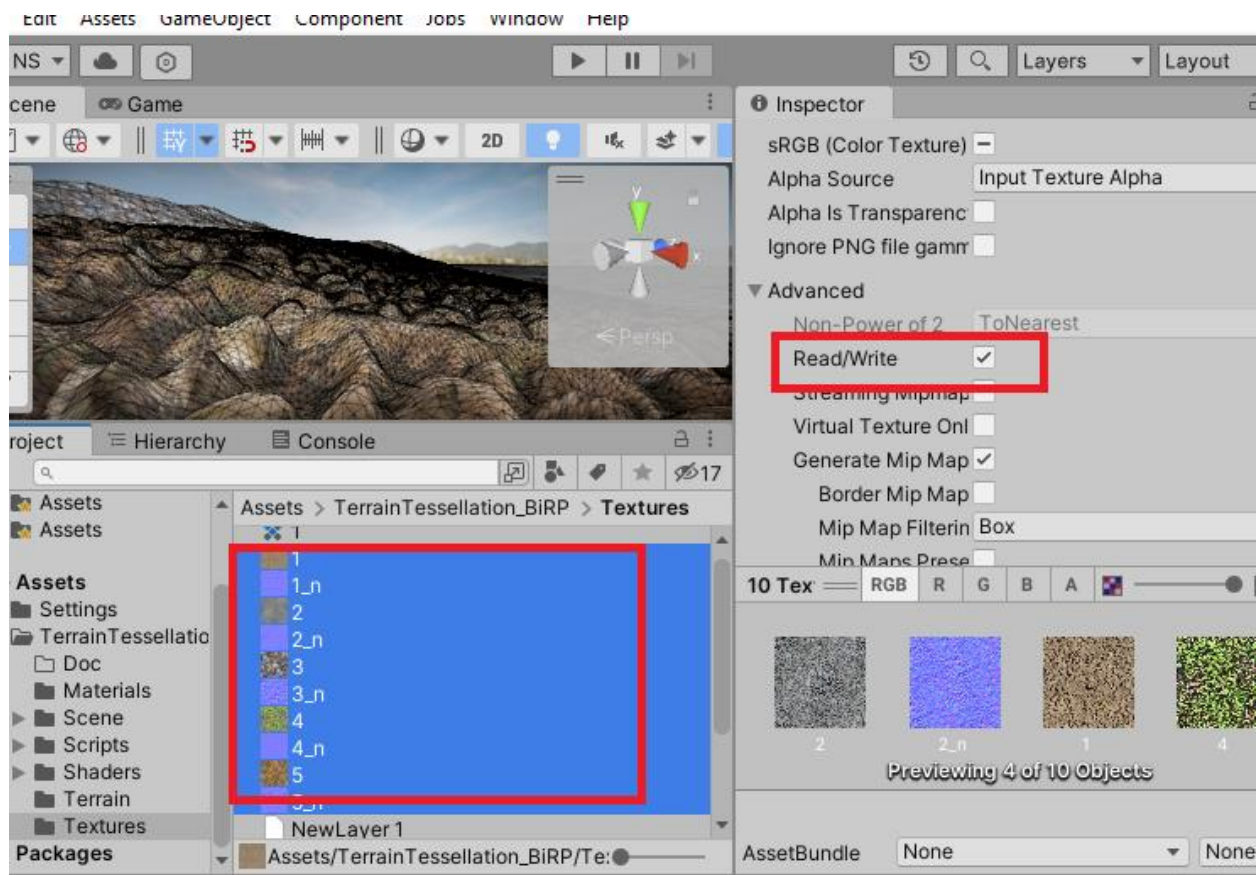

First you need at least 4 textures + 4 normal map textures with a exactly same texture size

For example your all 4 textures and normal maps must be 1024x1024 or 2048x2048 or other values

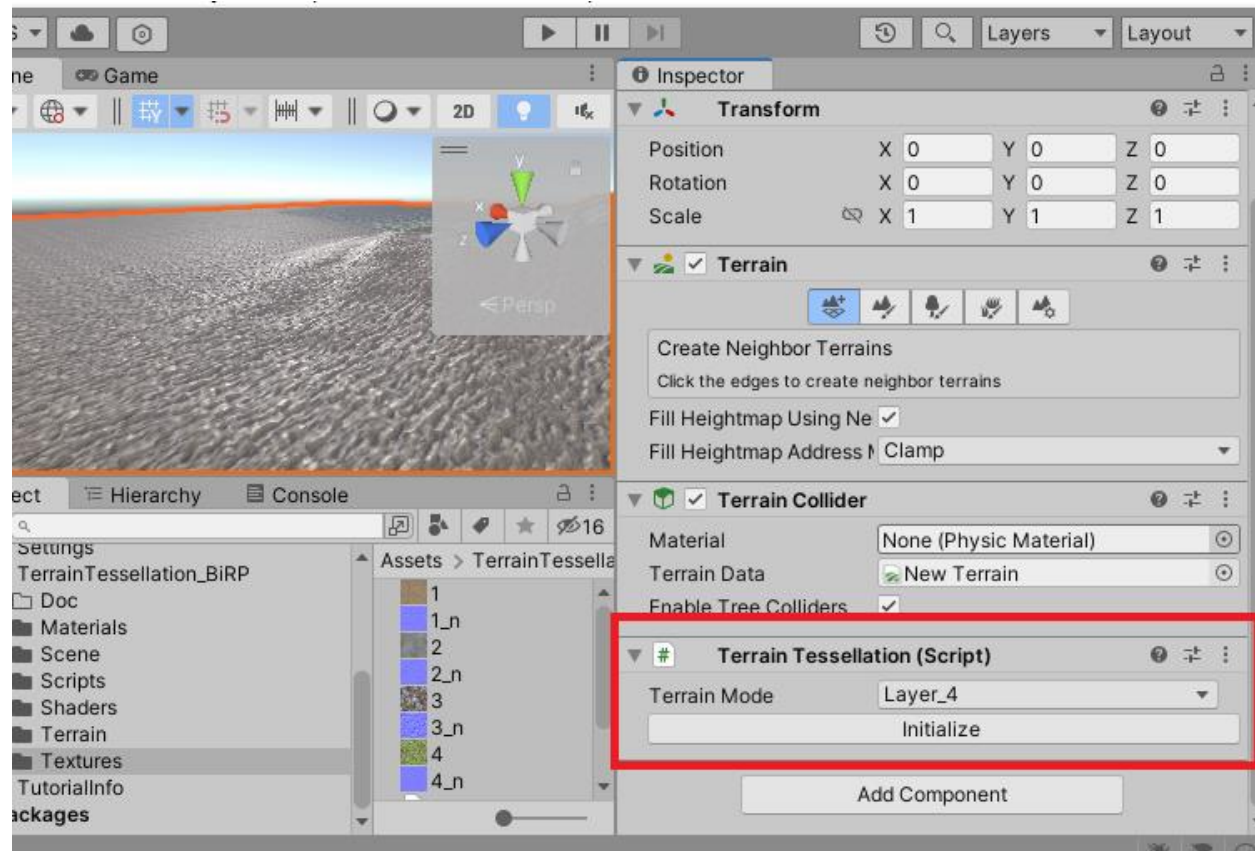

So you can not use a different texture size for terrain splat layer textures

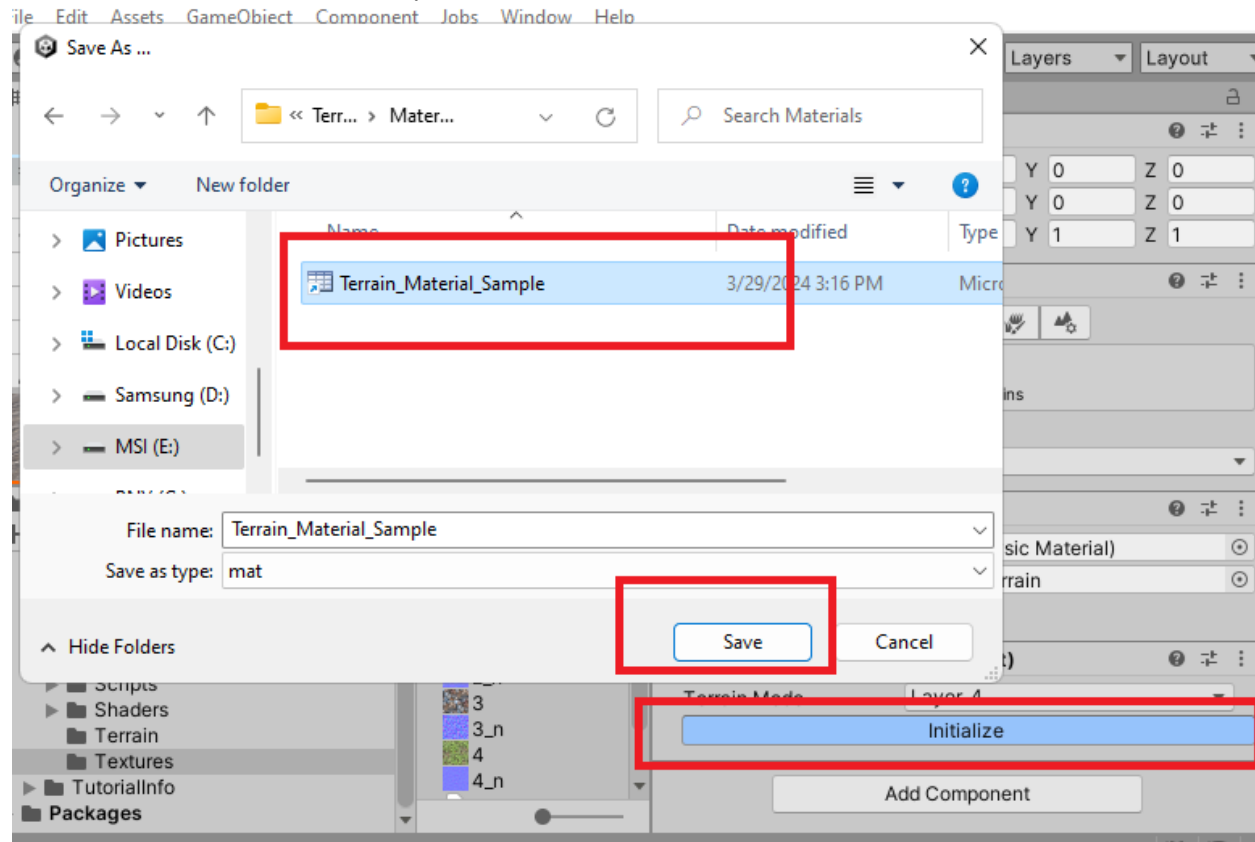

Your all textures must be market as Read\Write enabled:

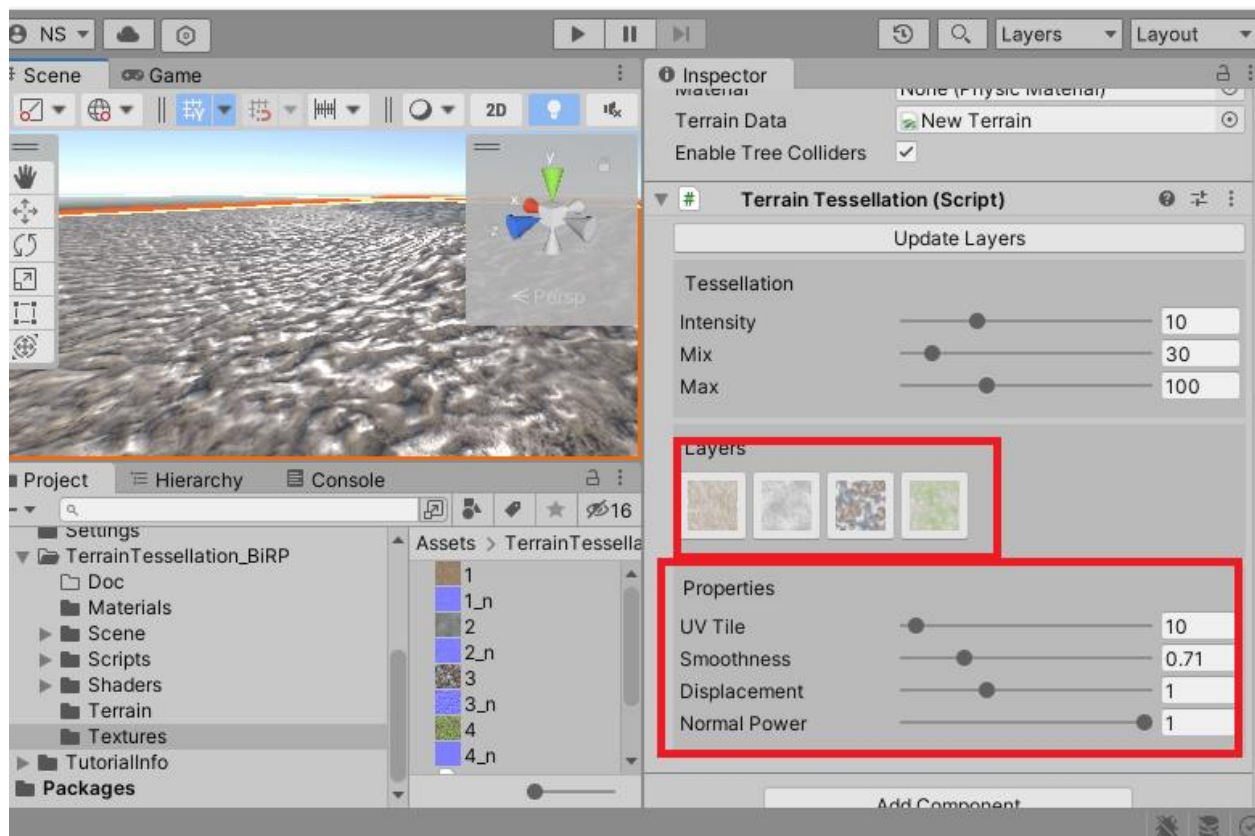

Now you can easily add Terrain Tessellation component (script) into your terrain:

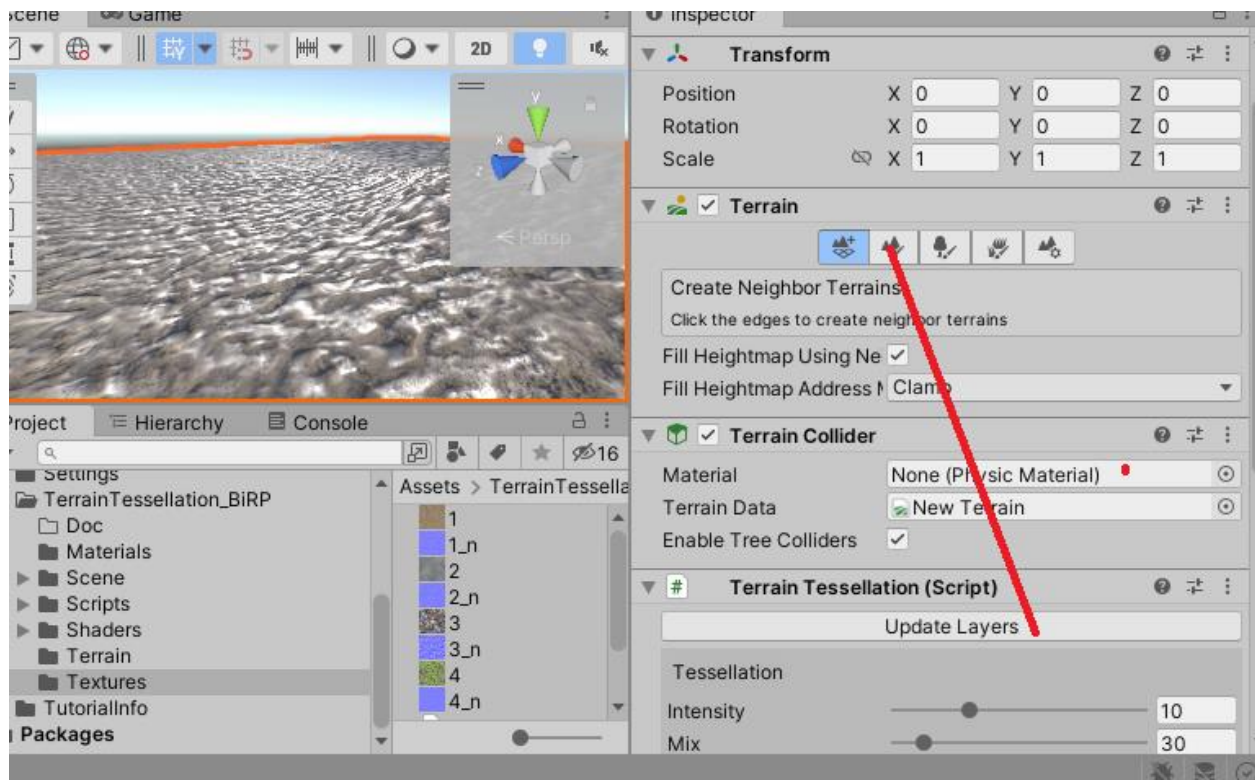

Now select your terrain layer count (4 or 6 or 8) and press initialize button. Then select a path to create a tessellation terrain material for your terrain:

Now you can select each layer and control its settings:

If at any time you change the texture of the layer, you must press the update button:

Also, you can determine the tessellation quality as well as the minimum and maximum rendering distance from the below section to achieve your desired quality and performance:
